Ingestion Service

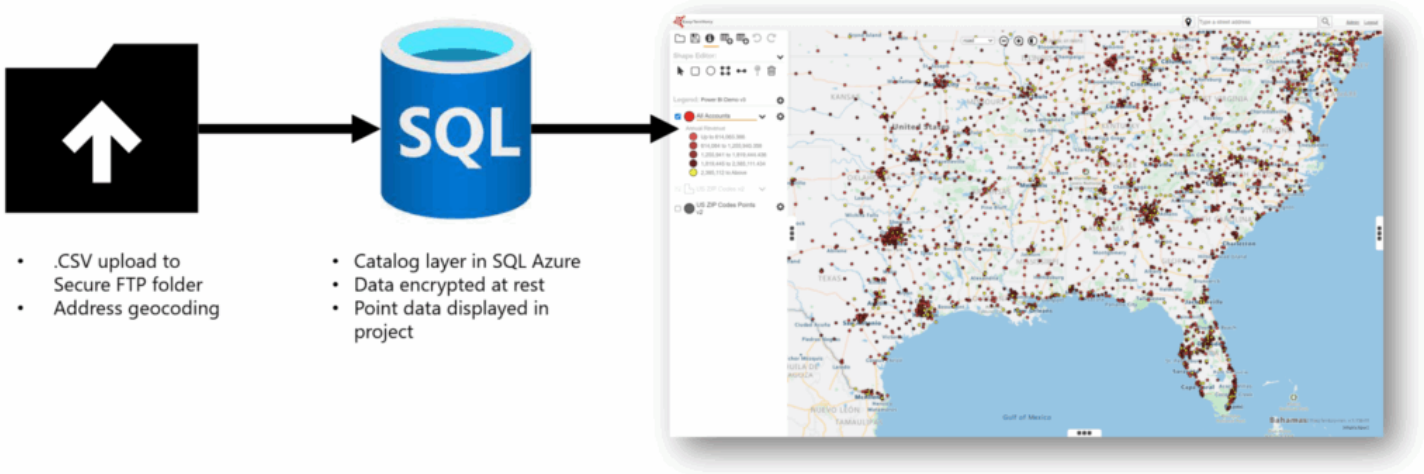

Administration · https://www.easyterritory.com/documentation/territory-designer/administration/ingestion-service/

Overview:

The EasyTerritory Ingestion Service is a feature of EasyTerritory Enterprise Edition (cloud-hosted) that allows organizations to push a flat file (.csv) to a secure FTP folder for automated data loads into an EasyTerritory Designer catalog layer. The Ingestion Service is a great option for automating a data (e.g. Accounts, Leads, Work Orders, Asset Locations, etc.) load into EasyTerritory to get refreshed information in a timely manner. The EasyTerritory Ingestion Service loads the .CSV file into a SQL Azure table that the EasyTerritory Enterprise web application can display as a catalog (map) layer in a project.

Features of the ingestion service include:

- Flexibility on push frequencies of an entire file or delta records.
- Address records without Latitude and Longitude are geocoding using Microsoft's Azure Maps service.
- Up to 3 catalog layers are supported with an EasyTerritory Enterprise Subscription.
- Ingestion setup and ongoing column additions should be coordinated with your EasyTerritory Customer Success Manager.

For more information on setting up the EasyTerritory Ingestion Service, please contact support@www.easyterritory.com.
